

# Sentiment Analysis — Summary Report

Amazon Fine Food Reviews | Internship Week 1 Project

| Metric                 | Value         |
|------------------------|---------------|
| Total Reviews Analysed | 4,984         |
| Positive Reviews       | 4,403 (88.3%) |
| Negative Reviews       | 501 (10.1%)   |
| Neutral Reviews        | 80 (1.6%)     |

## Key Findings

- **88.3% of reviews are Positive.** This clearly shows that the vast majority of Amazon food customers are satisfied with their purchases, reflecting strong overall product quality.
- **Negative reviews centre around flavour and misleading descriptions.** Customers frequently complain that the actual taste of the product differed from expectations set by product photos or descriptions.
- **TextBlob sentiment vs. star ratings do not always match.** A surprising finding was that several 1-star and 2-star reviews were still classified as 'Positive' by TextBlob — customers tend to use polite language even in complaints, which confuses word-level sentiment models.
- **Recommendation:** The business should set up an automated alert system for newly submitted 1-star and 2-star reviews, quickly identifying recurring complaints about specific products. Addressing flavour and packaging issues early can significantly improve customer retention and overall star ratings.
